**Tilton 600-Series Pedal Assemblies**

**Proportioning Valves**

Tilton uses Finite Element Analysis (FEA) to design the strongest pedal assemblies possible without adding excess weight. All are designed to accept any master cylinders with standard 2.25 inch mounting hole spacing (master cylinders sold separately). The brake pedals are designed for dual master cylinders and are equipped with an adjustable bias bar which can accept a remote cable (sold separately). The clutch pedals are designed for hydraulic clutch actuation. All pedals feature adjustable pads. The Overhang Mount and Underfoot Mount versions point the master cylinders toward the rear of the car, over or under the driver’s feet. The Firewall and Floor Mount units point the cylinders forward. The Tilton assemblies also feature adjustable-height pads on the brake and clutch pedals.

**Master cylinders sold separately, see pages 126-127**

**Brake Proportioning Valves**

Allow a driver to reduce brake pressure to a specific wheel or wheels. This can be used to adjust front-to-rear brake bias in cars where brake balance bars are not allowed or are not practical. The maximum reduction of output pressure is approximately 50% of the input pressure. Complete instructions are included.
